

# Acupuncture Can Treat Hot Flashes

Published by [Health & Medicine](#) on July 22, 2014

A review of more than 100 studies shows that menopausal women may benefit from acupuncture to treat hot flashes.

*AsianScientist (Jul 22, 2014)* – A meta-analysis of randomized controlled trials published in *Menopause* indicates that acupuncture can affect the severity and frequency of hot flashes for women in natural menopause.

An extensive search of previous studies evaluating the effectiveness of acupuncture led by Dr. Chiu Hsiao-Yean of Taiwan Medical University

uncovered 104 relevant studies, of which 12 studies with 869 participants met the specified inclusion criteria to be included in the present analysis. While the studies provided inconsistent findings on the effects of acupuncture on other menopause-related symptoms such as sleep problems, mood disturbances and sexual problems, they did conclude that acupuncture positively impacted both the frequency and severity of hot flashes.

Women experiencing natural menopause and aged between 40 and 60 years were included in the analysis, which evaluated the effects of various forms of acupuncture, including traditional Chinese medicine acupuncture (TCMA), acupressure, electroacupuncture, laser acupuncture and ear acupuncture.

Interestingly, neither the effect on hot flash frequency or severity appeared to be linked to the number of treatment doses, number of sessions or duration of treatment. However, the findings showed that sham acupuncture could induce a treatment effect comparable with that of true acupuncture for the reduction of hot flash frequency. The effects on hot flashes were shown to be maintained for as long as three months.

Although the study stopped short of explaining the exact mechanism underlying the effects of acupuncture on hot flashes, a theory was proposed to suggest that acupuncture caused a reduction in the concentration of  $\beta$ -endorphin in the hypothalamus, resulting from low concentrations of estrogen. These lower levels could trigger the release of CGRP, which affects thermoregulation.

“More than anything, this review indicates that there is still much to be learned relative to the causes and treatments of menopausal hot flashes,” says North American Menopause Society executive director Dr. Margery Gass. “The review suggests that acupuncture may be an effective alternative for reducing hot flashes, especially for those women seeking non-pharmacologic therapies.”

A recent review indicated that approximately half of women experiencing menopause-associated symptoms use complementary and alternative medicine therapy, instead of pharmacologic therapies, for managing their menopausal symptoms.
